

MANEGE FOR CAMPUS MEDICUL CENTER

BANDARANAYAKE H.A.C.S.

2019/E/021

INDIVIDUAL DATABASE APPLICATION ASSESSMENT

EC5070 DATABASE SYSTEMS

SEMESTER 5

DEPARTMENT OF COMPUTER ENGINEERING

UNIVERSITY OF JAFFNA

1. PROBLEM STATEMENT

1. High Level Problem Summary

Most of the universities in Sri Lanka have medical centers. In those centers, registration process of the students are done in manually. In that case, data may be lost and there is not enough space to keep the data files. As well as in those centers, there aren't any medical records of the students which they already submitted when they were enrolling. And also some student haven't any information about the working hours of the medical center. The students who accommodate outside of the hostel, they have to pay addition charges to get medicine from the outside as they aren't able to come inside to the university premises. Same time student have to come to medical center and have to be waited in Queues. Therefore they time may be wasted. As well as it is not easily to check medical history of the student if the records were done by manually. And it is hard to calculate the cost per day and to keep the records about the remaining medicines. The primary success criterion is the deployment of a website to manage and apply student details along with an online bulletin board. The main scope of the project is to manage medical center online and maintain the process of getting medicine easily and keep the records of the students clearly. Therefore, using the records of the past, the medical officers of the center can able to predict the occurrence of diseases at any time and calculate the cost of medicines needed at that time. Personal medical records of the student can be issued to given administer medications. It can avoid mistakes and those reports can be acceptable. You can keep your medical record with you to use at any time and it recommended under the doctor

2. Detailed Problem Statement

2.1 FUNCTION

I proposed this University Management website can be used in admitting the students in to the University. Students should register to the system with the email while they entering the university. Before student become an uncomfortable with her/his medical condition, he has to log to the website and update the problem to the website. Then, the medical officers will check the patients daily and give the sequence number and consider the severity of the disease. Sometimes if a student want to know more about her or him disease, then the student can enter him/her disease and they can check and identify the disease using the symptoms which he enter and they can get know about some first aids. Uploading of medications and medical recommendation taken by patients on that day to the website, student can submit the medical report online to the faculty administration office directly. After they came to get medicine, the doctor can check his or her medical Updates, personal history easily and give medical safety after the patient arrives. Then we can check and know what the most common disease is and how we have to get precautions for the disease. Every day, they can update the records about the medicine such as which medicines are used regularly, which are the remaining ones. After they can recognize the daily consumptions of the medicines and if needed they can request for those medicines early. Problem Statement Guide

2.2 TIME

Till now, student registration to medical center is manually and with paper works. It takes much time and efficiency is very low. When a student is sick, he must go to the medical center and register first and then wait for the doctor to see him. It's boring and takes too much time, so it's hard to manage. It is difficult to take medicine when there are many students. One problem which can be occurred is, about doctor's arrival time. If the student is registered before, he should find his medical file and it is very difficult to find his personal file among many files. There is not enough space in the medical center to hold this filling and congestion is created. The file has the student's medical history, but there is no indication of his response to medication. The doctor does not have any understanding about the medical that is given on campus and this is also a problem in giving medicine.

With this proposed University Management system, hostel administrations medical center no needs to maintain any kind of paper works or records manually, it saves lot of time. Administering medication can be done efficiently and effectively and omissions can be prevented. The medical center can manage its work well and provide good service. From this, there is a good belief among the students about the medical center and they can do their work quickly and save money.

In future, Receiving suggestions and complaints from students. To provide good service. Updating the website to provide treatment to students as well as preachers and workers. Establishing a relationship with the selected hospital. Getting information about vehicles that can be used in emergencies. The university as well as various institutions should be made aware of the website and thereby say that these institutions will be able to get an idea about the employees working there. Selling websites to various organizations and from that money can be earned.

3 KEY CHALLENGES FACED

- I choose NodeJS for programming language. This is a main challenge that I have faced. I had to learn NodeJS . Face many problems after connecting front_end and back_end. After that I had learned html, ejs and css but node js didn't support css file parth and then many error came and I solve this problem but I west many time .
- It was little bit harder to map the mini world scenario to the ER diagram because have not get information about the medical center.
- Finding data to enter into the database was difficult.

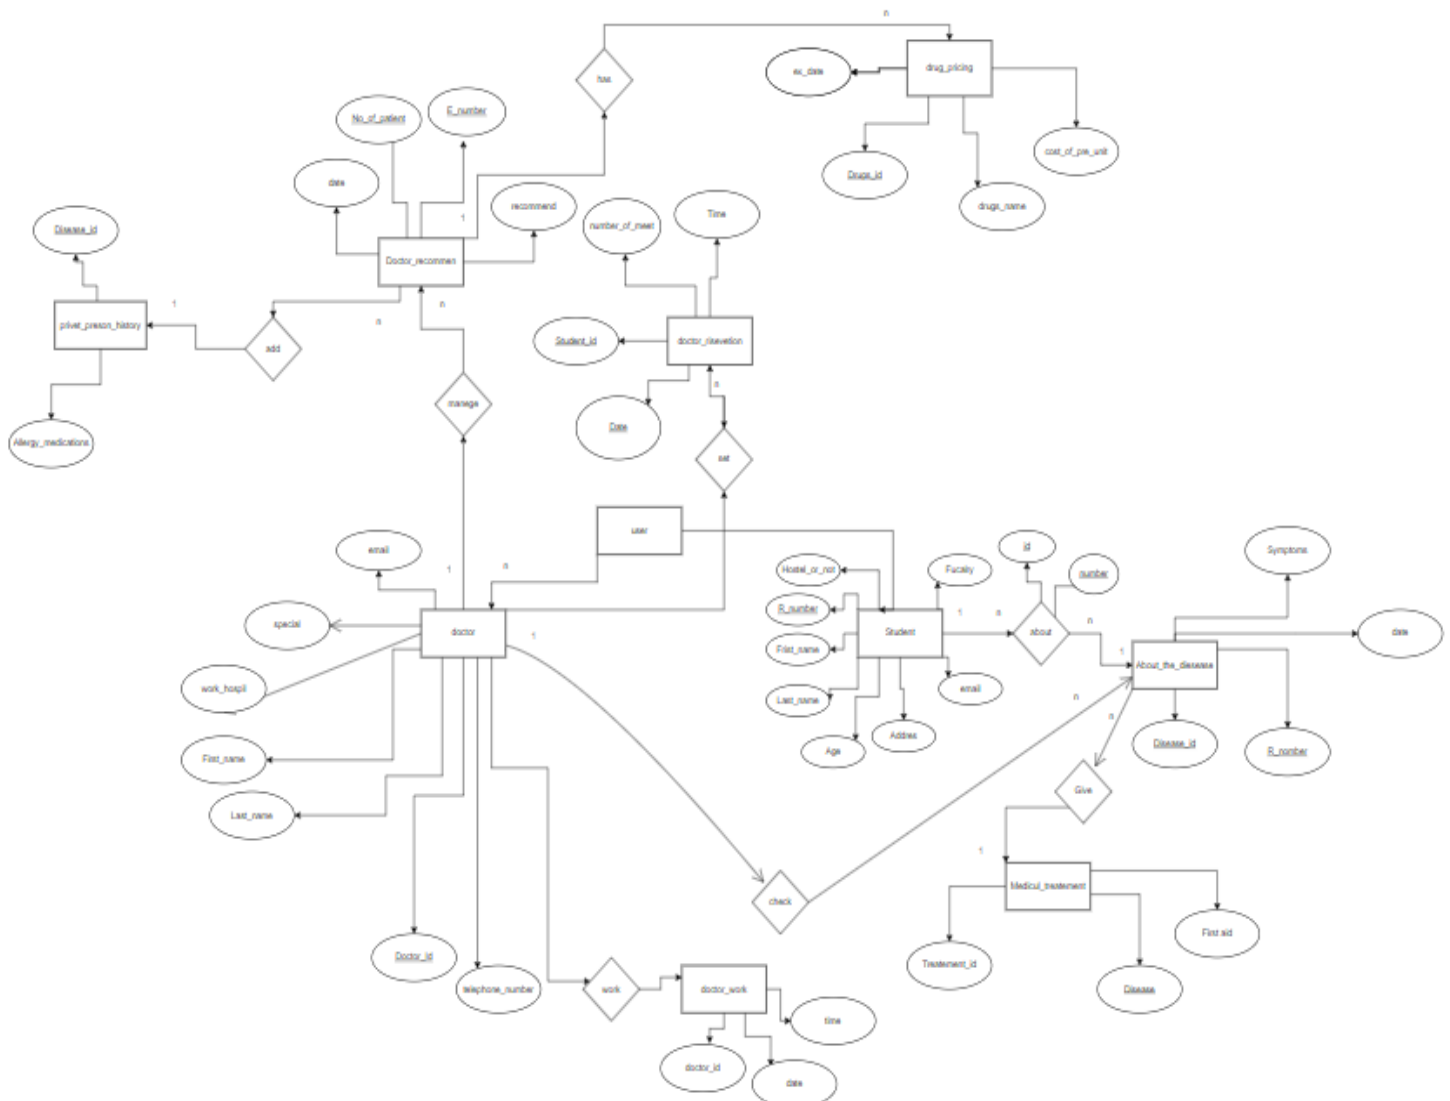

4. DATABASE DESIGN

The database has total 9 tables.

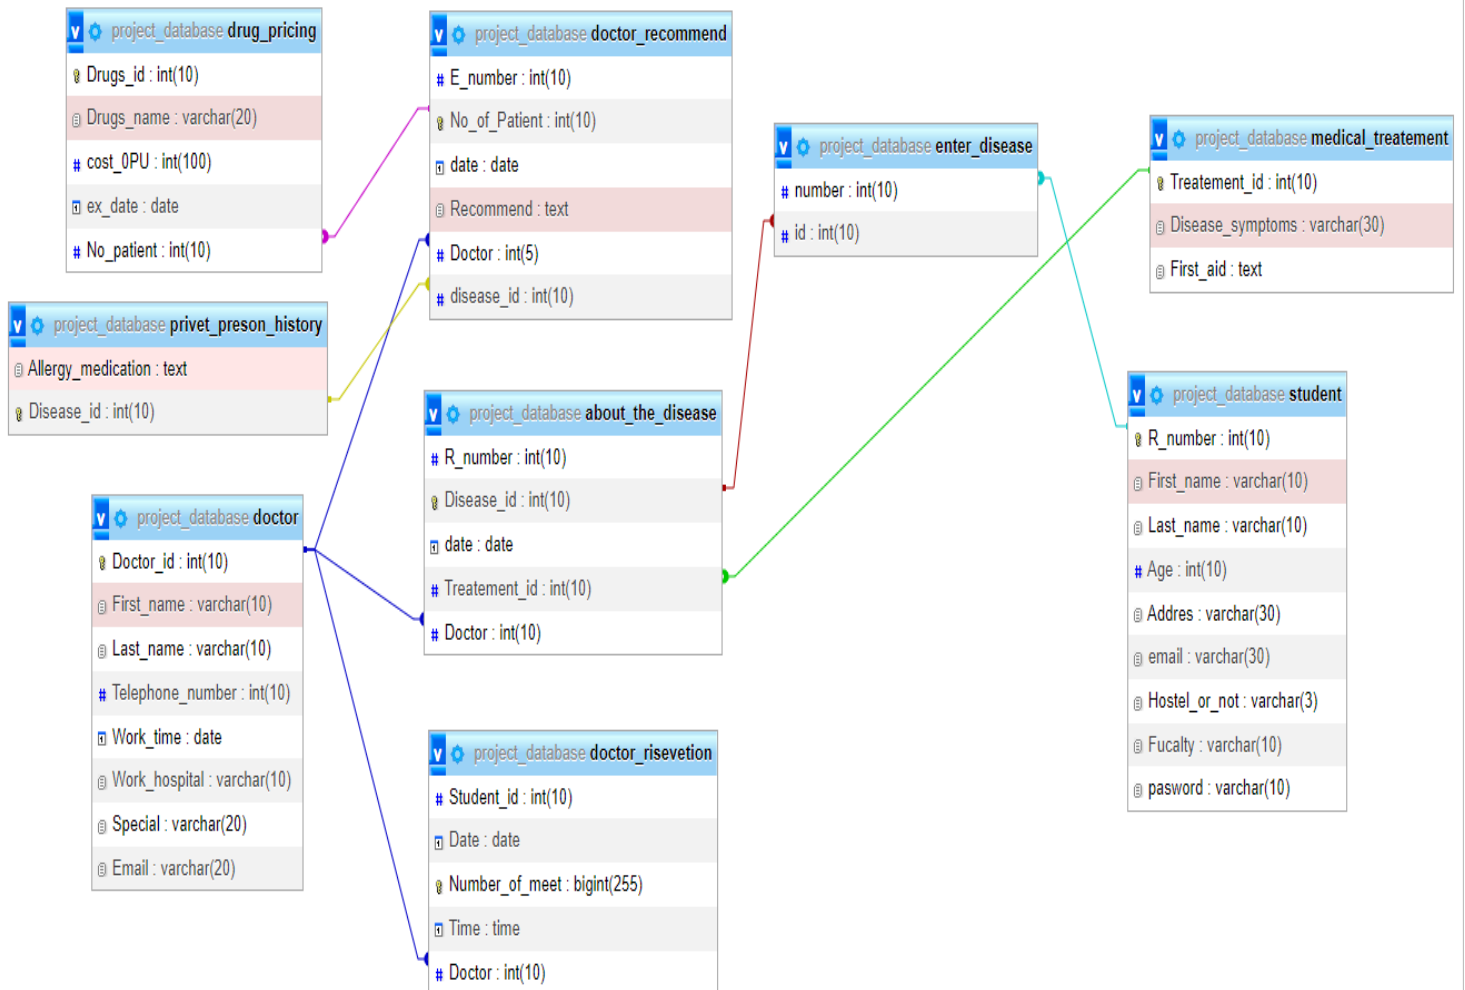

- 1) Student : Store the data of student
- 2) Doctor : store the data of doctor

- 3) About-the_disease : Store the disease of student
- 4) Medical_treatment : find first aid of the disease
- 5) Doctor_risevetion : get the information about what time meet the doctor
- 6) Doctor_recommend : what is doctor recommend of desease
- 7) Grug_pricing: information of drugs
- 8) Privet_preson_history: privet medical history of the student
- 9) Enter_disease: one by one student have what disease

5.2 Get Main Disease

SQL Query

```
function getmaindisaese(date1,date2){
  return new Promise((resolve, reject) => {
    sql = `SELECT ab.Treatement_id,md.Disease_symptoms,md.First_aid
    FROM about_the_disease as ab
    INNER JOIN medical_treatement as md
    ON ab.Treatement_id = md.Treatement_id
    WHERE ab.date between "${date1}" and "${date2}"`;
    db.query(sql, (error, result) => {
      if (error) console.log(error.message);
      resolve(result);
      console.log(result)
      reject(new Error(" Error"));
    });
  });
}
```

5.3 Register Student

SQL Query

```
function addStudent(details) {
  return new Promise(async (resolve, reject) => {
    console.log(details);
    let {R_number,First_name,Last_name,Age,Address,email,Hostel_or_not,Fucalty,pasword} = details;
    //console.log(first_name);
    let sql = `INSERT INTO student(R_number,First_name,Last_name,Age,Address,email,Hostel_or_not,Fucalty,pasword)
    VALUES('${R_number}','${First_name}','${Last_name}','${Age}','${Address}','${email}','${Hostel_or_not}','${Fucalty}','${pasword}')`;

    db.query(sql, (error, _results) => {
      if (error) {
        console.log(error.message);
        resolve(false);
      }
      resolve(true);

      reject(new Error("from addstudent"));
    });
  });
}
```

Report

The screenshot shows a web browser window with the URL `http://localhost:4000/api/student/get`. The page displays a "Registration Form Student" with the following fields: Register Number, First Name, Last Name, Age, Address, Email, Hostel_or_not, and Faculty. Below the fields are two buttons: "Sign Up" and "Login Here". The "Login Here" button is highlighted in orange. The browser's address bar shows the URL, and the top navigation bar includes links for Home, Login, and About Us. The Windows taskbar at the bottom shows the system clock as 10:39 PM on 11/17/2022.

5.4 Get Student

SQL Query

```
function getstudent() {  
  return new Promise((resolve, reject) => {  
    sql = `SELECT * FROM student`;  
    db.query(sql, (error, result) => {  
      if (error) console.log(error.message);  
      resolve(result);  
      console.log(result)  
      reject(new Error(" Error"));  
    });  
  });  
}
```
